A background network diagram consisting of several white circles of varying sizes connected by thin grey lines. The circles are arranged in a non-uniform pattern, with some having more connections than others. The central circle is the largest and contains the text.

**#Android**

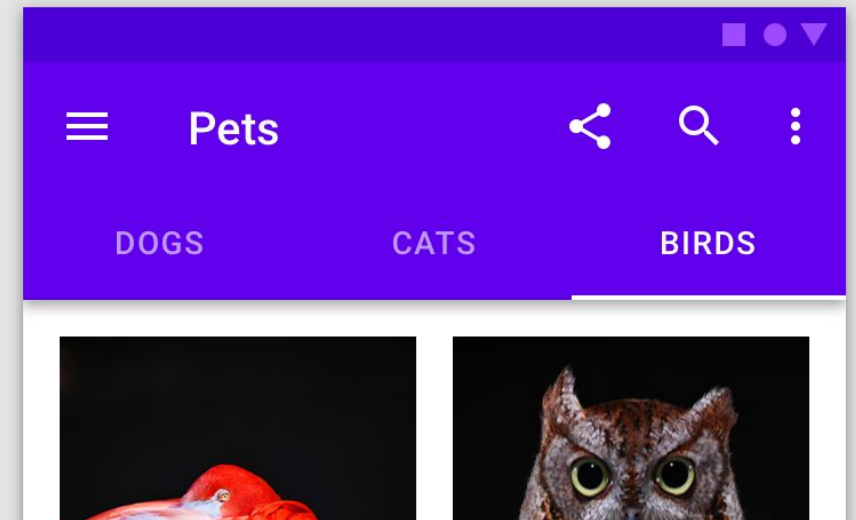

- Material Design is the name of the collection of guidelines used when designing for Android
- It has had several iterations over the years, starting with Android 5.0 Lollipop
- It relies on real-world interactions (hence “material”)

Source: <https://material.io/develop/android/>

# Tabs vs Bottom Navigation

- Tabs are navigation buttons shown in a bar at the top (usually)
- Bottom Navigation is shown at the bottom of the screen
- BN is usually used for top-level navigation and has icons
- Tabs can be used also for internal screen navigation. Can be text-only

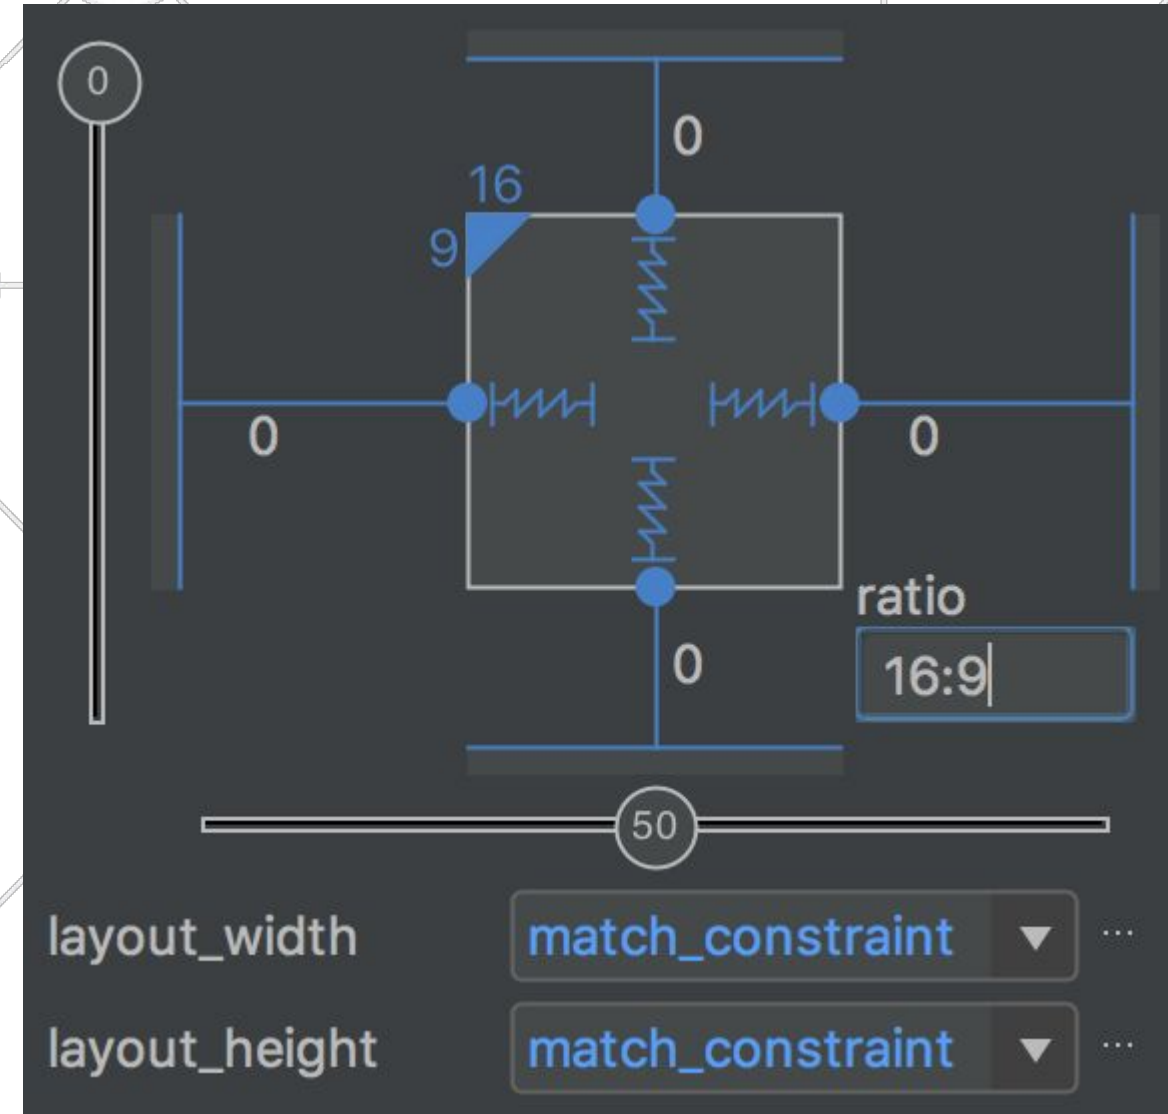

# **Demo**

## **Bottom Navigation**

# Constraint Layout

- Iteration of Relative Layout
- Helps keep the view hierarchy flat
- All attributes can be easily set from the Design Tab, without writing code

Source: <https://developer.android.com/training/constraint-layout>

- Each view has to have at least one vertical and one horizontal constraint
- For view sizes we have: fixed size, wrap\_parent and match\_constraint
- The Layout Editor allows us:
  - To convert a relative layout into a constraint layout
  - To automatically set constraints depending where the view is
  - To easily align multiple views together
  - To set default margins

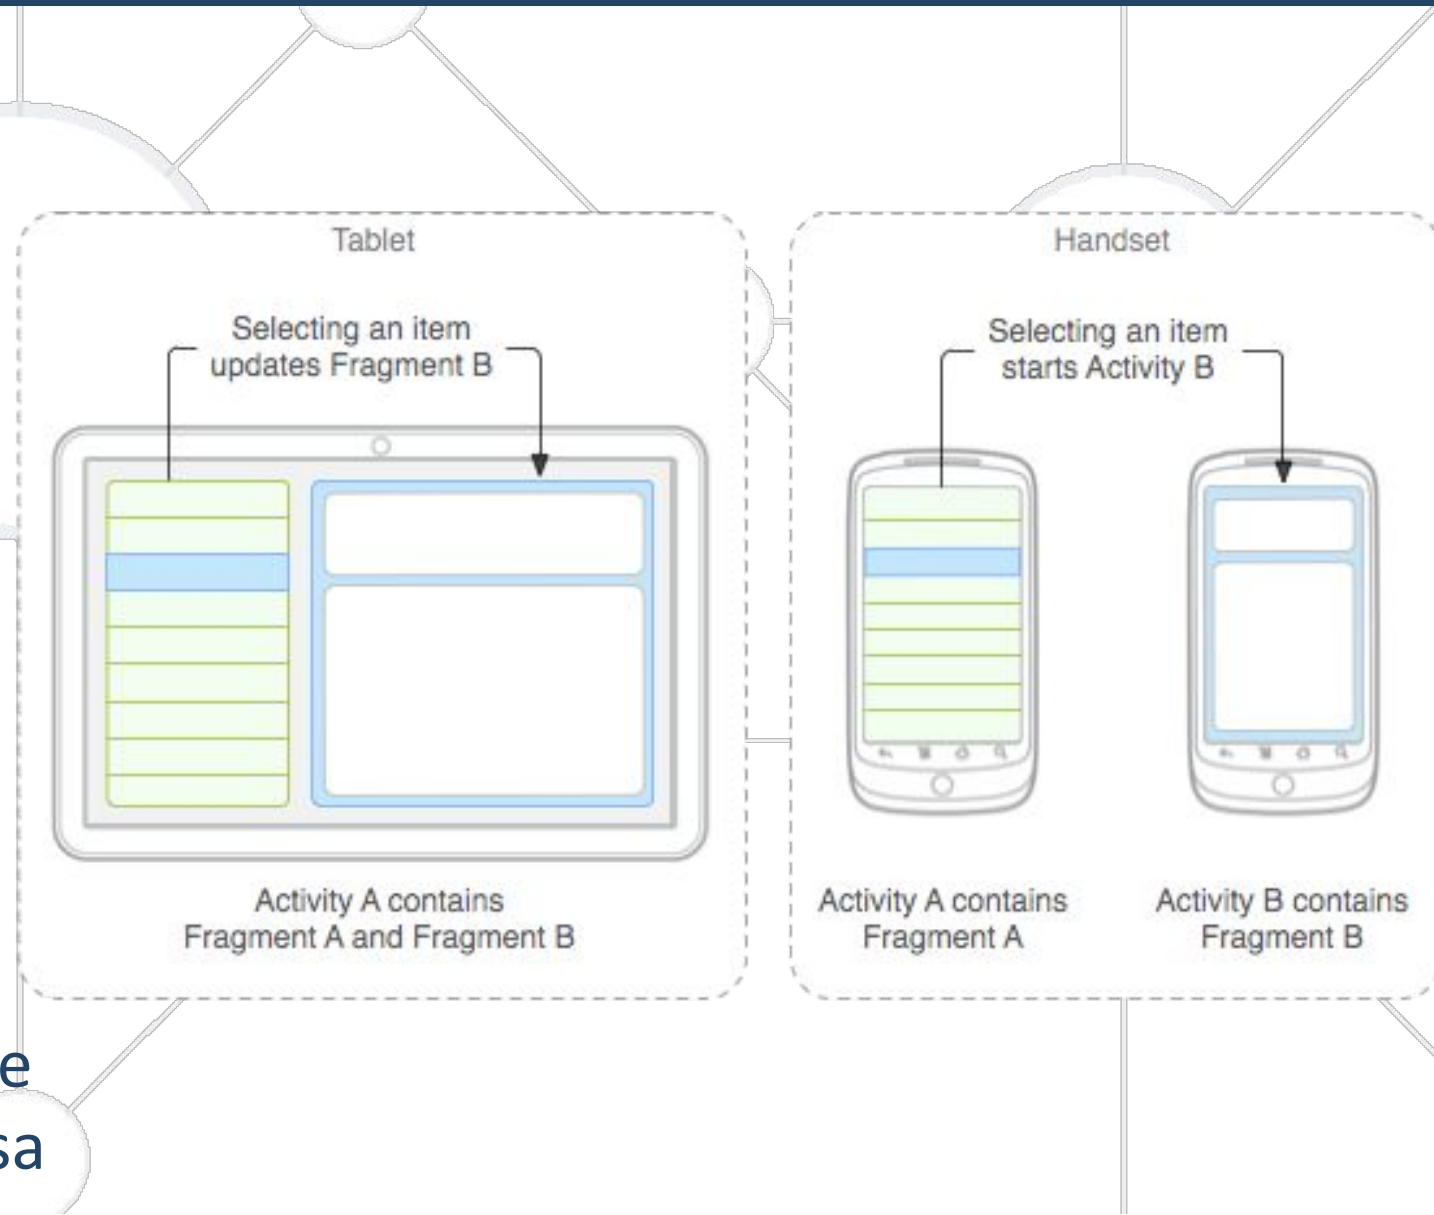

# Demo

## Constraint Layout

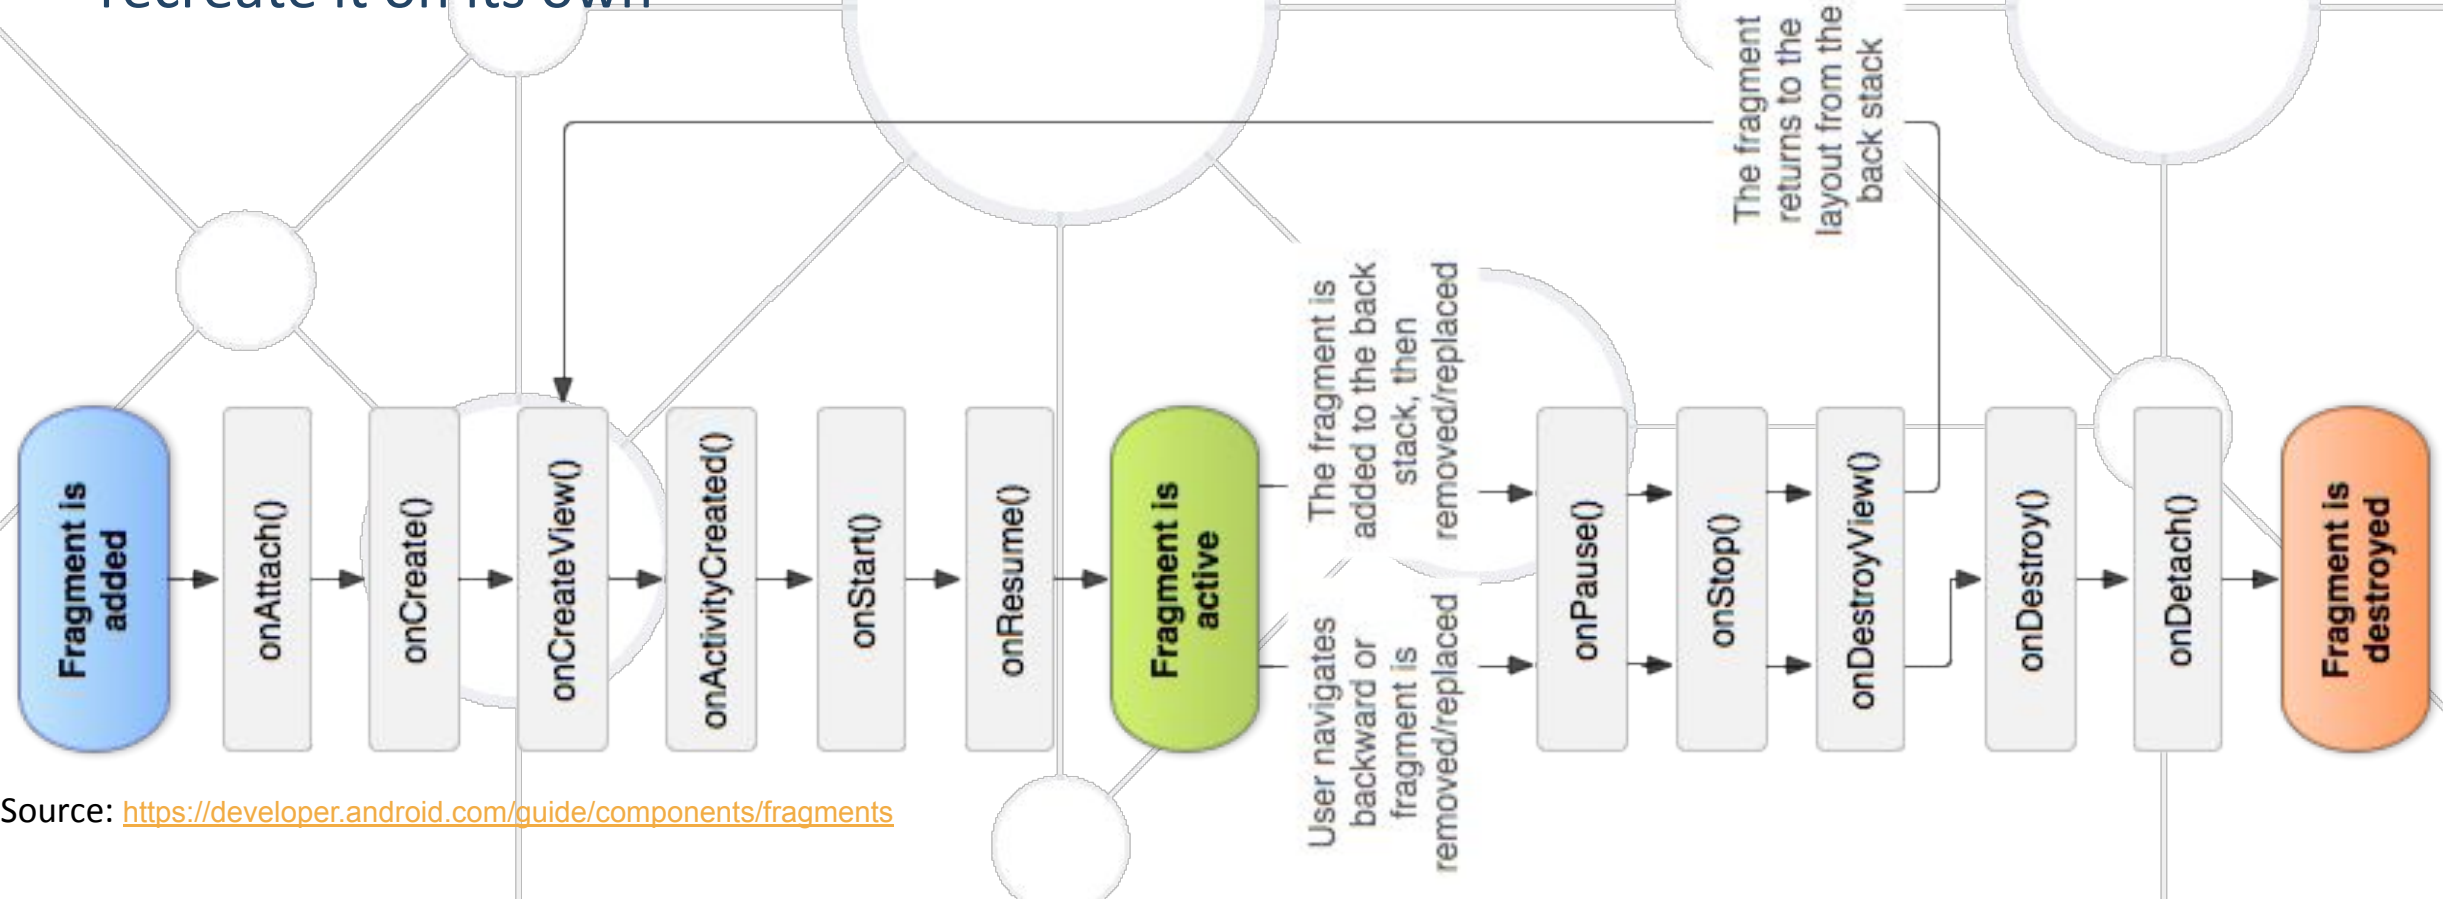

# Fragments

- Fragments can be viewed as sub-activities
- In reality, they are ordinary view groups
- Fragments have a life-cycle
- They need to be attached to an activity
- One activity can have many fragments
- Fragments can be attached, detached, swapped while the activity is running
- Fragment lifecycle depends on the activity lifecycle, but not vice-versa

# Fragment Lifecycle

- Lifecycle is similar to the activity lifecycle
- Main difference is the onCreateView method, which handles fragment's layout inflation
- A fragment needs an empty constructor, so the Android system can destroy and recreate it on its own

Source: <https://developer.android.com/guide/components/fragments>

# Adding a Fragment

- Static:

```
<LinearLayout  
    android:layout_width="match_parent"  
    android:layout_height="match_parent">  
    <fragment android:name="com.example.news.ArticleListFragment"  
        android:layout_width="match_parent"  
        android:layout_height="match_parent" />  
</LinearLayout>
```

# Adding a Fragment

- Dynamic:

```
FragmentManager fragmentManager = getFragmentManager();  
FragmentTransaction fragmentTransaction =  
    fragmentManager.beginTransaction();  
  
ExampleFragment fragment = new ExampleFragment();  
fragmentTransaction.add(R.id.fragment_container, fragment);  
transaction.addToBackStack(null);  
fragmentTransaction.commit();
```

- From Activity to Fragment:
  - keep fragment instance in Activity and call fragment methods directly
- From Fragment to Activity
  - Pass a callback when the Fragment is created

```
public class HeadlinesFragment extends Fragment {  
    OnHeadlineListener callback;  
  
    public void setOnHeadlineListener(OnHeadlineListener callback) {  
        this.callback = callback;  
    }  
    public interface OnHeadlineListener {  
        public void onArticleSelected(int position);  
    }  
}
```

```
public static class MainActivity extends Activity  
    implements OnHeadlineListener {  
  
    @Override  
    public void onAttachFragment(Fragment fragment) {  
        if (fragment instanceof HeadlinesFragment) {  
            HeadlinesFragment headlinesFragment =  
                (HeadlinesFragment) fragment;  
            headlinesFragment.setOnHeadlineListener(this);  
        }  
    }  
}
```

# Demo Fragments

**Fragments are the main UI element. Each fragment should be a new screen.**

# Homework (1)

Create an app with the following design.

It should have:

- Toolbar with action. Pressing the action should open a context menu.
- Bottom Navigation with Fragments
- The Feed page should have tabs
- The Stories tab should have a recycler view and a FAB
- Each element of the recycler view should be a card view
- Pressing the + FAB will open a new page where information can be added:
  - User image and name
  - Story image and text
  - Add Story button, upon pressing it the story is added to the local database and it's shown on Feed > Stories
- The scanner, gifts and profile screens can be empty
- The campaign screen can be empty

You will find resources for the design (icons) in the github of the course. (<https://github.com/android-soft-uni/03-Views-Layouts> )
